OCLC Number: (OCoLC)166328241 Subject: Groundwater -- Quality -- Massachusetts -- Cape Cod National Seashore. Excerpt: . . . inner shore of Nauset Beach in Pleasant Bay in 1626, was discovered 237 years later on the outer shore because the beach had moved west about 300 m (Wood, 2002). Escarpment erosion at the rate of 1 m per year accounts for the loss of a coastal strip of land 1 km wide during the last 1, 000 years, when sea level has been sufficiently high to cause erosion of the land surface (Leatherman and Zaremba, 1986). Temperature Change Ground-water temperature generally reflects the average air temperature of the region; therefore ground-water temperature would be expected to change if global warming changes the air temperature. The temperature-change effects on ground-water geochemistry have not been investigated widely, although temperature change has been hypothesized to influence some geochemical reactions, for example, the precipitation of travertine (Dramis and others, 1999). Temperature change can shift chemical equilibrium (changes are reaction-specific) and rates of both biological and chemical reactions (roughly a doubling in rate for every 10 C increase in temperature). Baseline and Trends Monitoring sea-level rise and erosion is covered by the hydrologic protocol written by McCobb and Weiskel (2003). Data about baseline conditions and trends in the temperature of aquifer water could be used to determine how climate warming might alter ground-water chemistry. Temperature could be monitored by recording ground-water temperature with a thermistor in a deep borehole. These data could be used for correlation with average air-temperature trends and for interpreting changes...
